OUR WATER. OUR COMMUNITY. OUR COMMITMENT.

YPWS ID#1530021

The Town of Watertown is pleased to provide the **2025 Water Quality Report**

Dear valued customer,

The Watertown Water and Sewer Authority (WSA) is pleased to provide its consumers with this report on the drinking water supplied to its customers in Watertown. The information contained in this report explains where your water comes from, what tests are performed to ensure the safety of your water as well as where you can acquire additional information about your water supply. We trust you will find this information both interesting and helpful. We want you to know more about the quality of your drinking water. Public participation is encouraged, and the WSA Board Regular Monthly Meeting schedule can be found on the WSA website. https://watertownct.org/departments/water_and_sewer/index.php

YOUR WATER QUALITY AT A GLANCE

Compliance

We are committed to providing
safe, reliable drinking water.

HOW SAFE IS YOUR WATER?

WHAT RISKS AFFECT OUR DRINKING WATER SOURCES?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the **Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791)**

The State of Connecticut Department of Public Health (DPH) in cooperation with the Department of Environmental Protection (DEP) recently completed an initial assessment of the Shepaug Reservoir System, which is a source of public drinking water that is maintained and operated by the Waterbury Water Department. This one-time assessment is part of a nationwide effort mandated by Congress under the Safe Drinking Water Act Amendments of 1996 to evaluate the susceptibility of all public drinking water sources in Connecticut to potential sources of contamination. DPH began working in partnership with the DEP in 1997 to develop Connecticut's Source Water Assessment Program, which was approved by the U.S. Environmental Protection Agency in 1999. Sources of potential contamination that are of concern to public drinking water supplies here in Connecticut are generally associated with historic waste disposal or commercial, industrial, agricultural and residential properties that store or use hazardous materials like petroleum products, solvents or agricultural chemicals.

The assessment is intended to provide Waterbury Water Department consumers with information about where their public drinking water comes from, sources of potential contamination that could impact it, and what can be done to help protect it. This initial assessment complete will also assist the public water supply system, regional planners, local government, public health officials and state agencies in evaluating the degree to which the Shepaug Reservoir System may be at risk from potential sources of contamination. The assessment can be used to target and implement enhanced source water protection measures such as routine inspections, protective land use regulations, acquisition of critical land, proper septic system maintenance, and public education. General sources of contamination with the potential to impact the Shepaug Reservoir System include properties with underground fuel storage tanks, improperly maintained on-site septic systems, improper waste disposal, or commercial/industrial sites that store or use chemicals or generate hazardous wastes.

To ensure that our sources of supply remain protected, the Waterbury Bureau of Water conducts annual Watershed Sanitary Surveys as well as semi-annual Water Quality and Pollution Source Assessments. This information is available by contacting the **Waterbury Bureau of Water at 203-574-8251**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Center of Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the **Safe Drinking Water Hotline at 1-800-426-4791**.

More information about contaminants and potential health effects can be obtained by calling the **EPA's Safe Drinking Water Hotline (1-800-426-4791)** or the **State of Connecticut, Department of Public Health (860-509-7333)**. Or visit their websites **epa.gov**

WHERE YOUR WATER COMES FROM

The sources of water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land through the ground, it dissolves naturally occurring minerals and some cases, radioactive material, and can pick up substances from the presence of human or animal activity.

The primary source of your water is the City of Waterbury's surface reservoirs located in two separate and distinct watersheds in Litchfield County.

The Shepaug and Cairns Reservoirs are located in the Shepaug Watershed and the Wigwam, Morris, and Pitch Reservoirs are located in the West Branch Watershed. Before the water is sent to you, it receives complete conventional treatment at Waterbury's Harry P. Danaher Water Treatment Plant located in Thomaston, CT.

The water is then pumped through a 36" pipe through the Town of Watertown. There are (2) metered connection points off the 36" where we receive water, the Fern Hill Road water booster station, and the Carvel meter pit. The Fern Hill Road water booster station pumps the water to the Scoville water storage tank on Buckingham Street which distributes the water to the "High Pressure Zone", located in northern section of town, and the Carvel pit distributes the water to the "Oakville Zone" and feeds the Bunker Hill Road water booster pump station. The Bunker Hill Road water booster station pumps to the Straits water storage tank which then distributes the water to the "Watertown Pressure Zone."

The water distribution system contains approximately 61 miles of 16-inch to 1.5" diameter water mains, three water booster pump stations, two water meter pits, two water storage tanks and over 655 fire hydrants. It serves over 4,150 water customers and approximately 9,972 people.

THE WATER TREATMENT PROCESS

FROM SOURCE TO TAP

SOURCE

TREATMENT

STORAGE

TO YOUR HOME
OR BUSINESS

OUR INFRASTRUCTURE. OUR PEOPLE.YOUR WATER.

Delivering safe, reliable drinking water every day takes more than pipes and pumps - it takes a team of dedicated professionals and well-maintained infrastructure working together for our community.

CRITICAL INFRASTRUCTURE

Our water system includes many essential assets that work together to deliver high-quality drinking water.

- Pump stations move water through the system
- Storage tanks provide capacity and pressure
- Miles of water main that distribute water throughout the community
- Hydrants support fire protection
- Valves control system flow

DEDICATED PROFESSIONALS

Our team is committed to providing safe, reliable water service to every customer, every day.

- Water system operators
- Maintenance technicians
- Customer service staff
- Engineering and compliance experts

Hydrant maintenance

Reliable equipment.

Keeping water flowing

**BUILT FOR TODAY.
PREPARED FOR TOMORROW.**

BUILDING FOR A STRONGER, MORE RELIABLE SYSTEM

CAPITAL IMPROVEMENTS

FERN HILL PUMP STATION UPGRADE

WSA completed a major upgrade at the Fern Hill Pump Station with the installation of a new 60-horsepower vertical turbine pump, along with associated valve and control system improvements. The project included the installation of new control valves, butterfly valves, and a Variable Frequency Drive (VFD) to enhance the station's overall performance and operational flexibility.

The new pump replaces an aging 20-horsepower lag pump and now serves as the station's primary distribution pump.

With substantially increased capacity and modern controls, the upgraded equipment improves the station's ability to meet system demands while maintaining reliable water service to customers.

These improvements increase operational efficiency, strengthen system reliability, and support the long-term sustainability of WSA's water distribution infrastructure. The Fern Hill Pump Station upgrade is part of **WSA's ongoing commitment** to investing in critical assets that ensure dependable service for the communities it serves.

INVESTING IN A STRONGER WATER SYSTEM

KEEPING OUR WATER MAINS CLEAN

Routine flushing helps maintain water quality throughout the distribution system.

WATER MAIN FLUSHING

Distribution mains (pipes) convey water to homes, businesses, and hydrants in your neighborhood. The water entering distribution mains is of very high quality; however, water quality can deteriorate in areas of the distribution mains over time. Water main flushing is the process of cleaning the interior of water distribution mains by sending a rapid flow of water through the mains.

Flushing maintains water quality in several ways. For example, flushing removes sediments like iron and manganese. Although iron and manganese do not pose health concerns, they can affect the taste, clarity, and color of the water. Additionally, sediments can shield microorganisms from the disinfecting power of chlorine, contributing to the growth of microorganisms within distribution mains. Flushing helps remove stale water and ensures the presence of fresh water with sufficient dissolved oxygen, disinfectant levels, and an acceptable taste and smell.

Routine flushing

During flushing operations in your neighborhood, some short-term deterioration of water quality, though uncommon, is possible. You should avoid tap water for household use at that time. If you do use the tap, allow your cold water to run for a few minutes at full velocity before use and avoid using hot water, to prevent sediment accumulation in your hot water tank.

Please contact us if you have any questions or would like more information on our water main flushing schedule. Our **water main flushing schedule** is posted on our website: watertownct.org/departments/water_and_sewer/index.php

KEEPING OUR WATER SAFE

Backflow prevention helps keep contaminants from entering the public water supply.

CROSS-CONNECTION PROTECTION

Cross-connections that contaminate drinking water distribution lines are a major concern. A cross-connection is formed at any point where a drinking water line connects to equipment (boilers), systems containing chemicals (air-conditioning systems, fire sprinkler systems, irrigation systems), or water sources of questionable quality. Cross-connection contamination can occur when the pressure in the equipment or system is greater than the pressure inside the drinking water line (backpressure). Contamination can also occur when the pressure in the drinking water line drops due to fairly routine occurrences (main breaks, heavy water demand), causing contaminants to be sucked out from the equipment and into the drinking water line (back siphonage).

Outside water taps and garden hoses tend to be the most common sources of cross-connection contamination at home. The garden hose creates a hazard when submerged in a swimming pool or attached to a chemical sprayer for weed killing. Garden hoses that are left lying on the ground may be contaminated by fertilizers, cesspools, or garden chemicals. Improperly installed valves in your toilet could also be a source of cross-connection contamination.

Community water supplies are continuously jeopardized by cross-connections unless appropriate valves, known as backflow prevention devices, are installed and maintained. We have surveyed industrial, commercial, and institutional facilities in the service area to make sure that potential cross-connections are identified and eliminated or protected by a backflow preventer. We also inspect and test backflow preventers to make sure that they provide maximum protection.

HOW BACKFLOW PREVENTION WORKS

**YOUR HOME
OR BUSINESS**

**BACKFLOW
PREVENTER**

MAIN**

For more information on backflow prevention, contact the Safe Drinking Water Hotline at (800) 426-4791.

DRINKING WATER & YOUR HEALTH

Drinking water can contain small amounts of naturally occurring or man-made contaminants.

WHAT ARE SOURCES OF WATER CONTAMINANTS?

MICROBIAL CONTAMINANTS such as viruses and bacteria, which may come from septic systems, agricultural livestock operations, and wildlife.

INORGANIC CONTAMINANTS such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

PESTICIDES AND HERBICIDES which may come from a variety of sources, such as agriculture, urban stormwater runoff, and residential uses.

ORGANIC CHEMICAL CONTAMINANTS including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also, come from gas stations, urban stormwater runoff, and septic systems.

RADIOACTIVE CONTAMINANTS which can be naturally occurring or be the result of oil and gas production and mining activities.

HOW IS SOURCE WATER PROTECTED?

CONNECTICUT PROHIBITS DISCHARGE of potential disease-carrying wastewaters into public drinking water supply sources.

FILTRATION AND DISINFECTION of all surface supplies is mandatory.

LAND AREAS (WATERSHEDS) that drain into public water sources must be inspected annually for pollution.

STATE AND LOCAL REGULATORS govern land use and development on watershed lands.

STRICT REGULATIONS GOVERN THE SALE AND THE USE OF WATER COMPANY-OWNED LAND which is critical to the protection of public water supply resources.

The Shepaug and Wigwam Reservoir systems, surface water and the overall susceptibility to potential contamination is “**moderate**.”

PFAS

For general information on PFAS, visit [epa.gov/pfas](https://www.epa.gov/pfas)

According to the EPA, Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS) are a group of manufactured chemicals that have been used in industry and consumer products since the 1940s because of their useful properties. There are thousands of different PFAS, some of which have been more widely used and studied than others. One common characteristic of concern of PFAS is that many break down very slowly and can build up in people, animals, and the environment over time. Initial research suggests that exposure to PFAS at elevated levels may be linked to health problems. WSA relies on the Waterbury Water Department to keep their customers informed on plans to comply with state and federal water quality standards for PFAS as they are developed by our regulators.

LEAD AND COPPER IN DRINKING WATER

When it comes to lead, there is no safe level of exposure.

Protecting your family's health starts at the tap.

Lead can cause serious health problems, especially for pregnant people and young children. Lead in drinking water is primarily from materials and parts used in service lines and home plumbing. The Watertown Water and Sewer Authority is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Before drinking tap water, flush your pipes for several minutes by running your tap, taking a shower, doing laundry or a load of dishes. You can also use a filter certified by an ANSI accredited certifier to reduce lead in drinking water. If you are concerned about lead in your water and wish to have your water tested, **contact the Watertown Water and Sewer Authority at (860) 945-5299. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at epa.gov/safewater/lead.**

LEAD IN DRINKING WATER

HEALTH EFFECTS

Exposure to lead in drinking water can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney, or nervous system problems.

SOURCES

Major sources of lead in drinking water are corrosion of household plumbing systems and erosion of deposits. WSA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When water has been sitting in the internal plumbing for several hours, you can minimize the potential for lead exposure by flushing your cold tap for 30 seconds to two minutes before using water for drinking or cooking.

COPPER IN DRINKING WATER

HEALTH EFFECTS

Copper is an essential nutrient, but some people who drink water containing Copper in excess of the action level over a relatively short time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's Disease should consult their doctor.

SOURCES

Major sources of copper in drinking water are: corrosion of household plumbing systems, erosion of natural deposits and leaching from wood preservatives.

For information on the levels of lead and copper detected in your drinking water system, please refer to the table in this water quality report.

STEPS YOU CAN TAKE

RUN YOUR TAP

Run your tap for 30 seconds to 2 minutes before using water for drinking or cooking, especially if the water has not been used for several hours.

USE COLD WATER

Use cold water for drinking, cooking, and making baby formula. Hot water can contain higher levels of copper.

CHECK YOUR PLUMBING

Copper levels can increase due to corrosion in older plumbing. Consider having your plumbing inspected if you are concerned.

BE INFORMED

Additional information is available from the U.S. **Environmental Protection Agency's Safe Drinking Water Hotline** website epa.gov/ground-water-and-drinking-water/safe-drinking-water-hotline or at 1-800-426-4791.

LEAD SERVICE LINE INVENTORY

Providing the best drinking water to our WSA customer is our top priority. As part of our commitment to public health and regulatory compliance, we have completed an initial Lead Service Line Inventory, providing customers with transparency regarding service line materials in our system.

THE INITIAL LEAD SERVICE LINE INVENTORY IS AVAILABLE TO VIEW

The Watertown Water & Sewer Authority has published the Initial Lead Service Line Inventory, which complies with the US Environmental Protection Agency's (US EPA) Lead and Copper Rule Revisions (LCRR). As part of the LCRR, water systems are required to inventory all water service line materials and identify any water service line that contains lead or lead materials. This inventory is updated annually. To view the inventory, please visit the WSA office located at 747 French St, Oakville, CT.

ABOUT SERVICE LINES

A service line is the narrow pipe that branches from the water main in the street to your address and brings water to the meter, which is usually located in your basement. The water mains distributing water are made of non-lead material. The public water system owns the street side portion (public or water system side) of the service line, and the property owner owns the yard-side portion (private or customer side).

IF YOU RECEIVED A NOTICE IN THE MAIL

Public water systems are required by US EPA and CT DPH to mail notifications to customers who have a Lead service line, a Galvanized Requiring Replacement service line, or an Unknown material service line. The notice was generated based on the Watertown Water & Sewer Authority's inventory of service lines. For more information please visit our website at

https://watertownct.org/departments/water_and_sewer/water_service_line_inventory.php

If you did not receive a notice, your service line is not made of lead or lead-containing materials.

WHAT THIS MEANS FOR YOU

Review Your Service Line Information: To review, you are welcome to come into the WSA office to look at a hard copy of the inventory.

Take Steps to Reduce Lead Exposure: If you have a lead or galvanized service line, you can reduce potential exposure by running your tap for at least 30 seconds to flush stagnant water before use, using a certified lead-removal filter, and regularly cleaning aerators. More information on lead in drinking water and steps to minimize exposure is available at EPA's Lead in Drinking Water website <https://www.epa.gov/ground-water-and-drinking-water/basic-information-about-lead-drinking-water>

NEXT STEPS

WSA is committed to updating our inventory and working with customers to verify and replace lead service lines. We will continue to monitor water quality and provide updates on our efforts to reduce lead exposure in drinking water.

TERMS & ABBREVIATIONS

Action Level (AL): The concentration that if exceeded, triggers treatment or other requirements that a water system must follow.

Location Running Annual Average (LRAA): Average of four quarterly results used to evaluate compliance.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Residual Disinfectant Level Goal (MRD): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLG's do not reflect the benefits of the use of disinfectants to control microbial contamination.

Millirems per year (NREM/YR): A measure of radiation absorbed by the body

Notification Level (NL): There is no MCL for sodium, however, the Connecticut DPH requires customers to be notified if sodium exceeds 28 ppm

Nephelometric Turbidity Unit (NTU): A measure of water clarity.

ppm: Parts per million, or milligrams per liter, mg/l

ppb or ug/L: Parts per billion, or micrograms per liter ug/l

pCi/l: A unit of measure of radioactivity.

TT: Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.

N/A: Not Applicable

N/R: Not Regulated

mg/L: Milligrams per liter

ND: Non-Detectable

MRL: Minimum Reporting Level

TREATED WATER QUALITY TABLES

CITY OF WATERBURY TESTING RESULTS AT TREATMENT PLANT 2025

PARAMETER					
MICROBIALS	MCL	MCLG	RESULTS	RANGE	SOURCE
TURBIDITY (NTU)	TT = 5 NTU Max Distribution	0	0.000	0.14 – 0.47	SOIL RUNOFF Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system.
			Percentage		
	TT = <0.30 NTU 95% of the time T-Plant Eff.	0	100%	N/A	
TOTAL COLIFORM BACTERIA	PRESENCE OF COLIFORM BACTERIA IN >5% OF MONTHLY SAMPLES	0	0%	N/A	NATURALLY PRESENT IN THE ENVIRONMENT
TOTAL ORGANIC CARBON (MG/L)	TT	N/A	1.84	1.66 – 2.00	NATURALLY PRESENT IN THE ENVIRONMENT

*Turbidity: Turbidity has no health effects. However, turbidity can interfere with disinfection and provide a medium for bacterial growth. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.

**Total Coliform Bacteria: Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems.

**Total organic carbon: Total organic carbon (TOC) has no health effects. However, total organic carbon provides a medium for the formation of disinfection by products. These byproducts include trihalomethanes (THMs) and haloacetic acids (HAAs). Drinking water containing these byproducts in excess of the MCL may lead to adverse health effects, liver or kidney problems, or nervous system effects, and may lead to an increased risk of getting cancer.

Inorganic	MCL	MCLG	Highest Detected Level (90th Percentile)	Range of Detection	Met Drinking Water Standards	Typical Source
Copper (PPM) Tested in 2025 (1 exceedance of 50 samples)	AL 1.3	AL 1.3	0.18 ppm	0 to 3.82 ppm	Yes	Corrosion of Household plumbing system
Lead (PPB) Tested in 2025 (1 exceedance of 50 samples)	AL 15	0	4 ppb	0 to 580 ppb	Yes	Corrosion of Household plumbing system

INORGANIC COMPOUNDS 2	RL	MAX level	MCLG(mg/L)	MCL(mg/L)	SOURCE
NITRATE / NITRITE (PPM)	N/A	N/A	--	--	RUNOFF FROM FERTILIZER USE; EROSION OF NATURAL DEPOSITS
NITRATE as N	0.025	ND	1	1	
NITRITE as N	0.01	ND	1	1	
SULFATE (PPM)	1.25	5.4	SDWR 250		
FLUORIDE (PPM)	0.25	0.65	SDWR 2		WATER ADDITIVE WHICH PROMOTES STRONG TEETH

*Nitrate: Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, die. Symptoms include shortness of breath and blue baby syndrome.

**Nitrite: Infants below the age of six months who drink water containing nitrite in excess of the MCL could become seriously ill and, if untreated, die. Symptoms include shortness of breath and blue baby syndrome.

***Fluoride: Some people who drink water containing fluoride in excess of the MCL over many years could get bone disease, including pain and tenderness of the bones. Fluoride in drinking water at half the MCL or more may cause mottling of children's teeth, usually in children less than nine years old. Mottling, also known as dental fluorosis, may include brown staining and/or pitting of the teeth, and occurs only in developing teeth before they erupt from the gums.

ORGANIC COMPOUNDS	RANGE DETECTED		Average	MCL	MCLG	SOURCE
TOTAL TRIHALOMETHANES (TTHM) (PPB)	29 – 53		53	80	0	BY PRODUCT OF DRINKING WATER CHLORINATION
TOTAL HALOACETIC ACID (THAA) (PPB)	29 – 50		44	60	N/A	
RADIOCHEMICAL *1	RANGE	HIGHEST	MCL		MCLG	SOURCE
GROSS ALPHA (α)*1(PCi/L)	3	ND	15 (MRMEM/Y)*		0	DECAY OF NATURAL AND MAN-MADE DEPOSITS
RADIUM 226 + 228 *1	1	ND	5 (PCi/L)		0	

*Combined Radium 226/228: Some people who drink water containing radium 226/228 in excess of the MCL over many years may have an increased risk of getting cancer.

* The State of Connecticut measures for the Radiochemical NET Gross ALPHA in Picocuries per Liter (pCi/L), the Federal measurement is in millirems per year (mrem/yr).

*The State of Connecticut, Department of Public Health, requires us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently.

Reference City of Waterbury 2025 Water Quality Report

Unregulated Contaminants Monitoring Rule (UCMR5)

Environmental Protection Agency (EPA) uses the Unregulated Contaminant Monitoring Rule (UCMR) to collect data for contaminants that are suspected to be present in drinking water and do not have health-based standards set under the Safe Drinking Water Act (SDWARS). This includes a process that EPA must follow to identify and list Unregulated Contaminants. UCMR 5 for Public Water Systems on 2023-2024 (12 months period-time) includes monitoring for a total of 30 chemical contaminants. There are 10 cyanotoxins (nine cyanotoxins and one cyanotoxin group) and additional contaminants (one metal, eight pesticides plus one pesticide manufacturing byproduct, three brominated halo acetic acid disinfection byproducts groups, three alcohols, and three semi volatile organic chemicals). The detection of a UCMR 5 contaminant does not represent cause for concern, in and of itself. Reference concentrations are health-based and provide context for the detection of a UCMR contaminant. In fact, they do not represent regulatory limits or action levels and should not be interpreted as an indication that the agency intends to establish a future drinking water regulation. UCMR occurrence data will be used to inform the Agency's Regulatory Determination process. For more information visit: epa.gov/dwucmr/fifth-unregulated-contaminant-monitoring-rule

The following list represents the results of sampling Unregulated Contaminants for entry point in 2023-2024:

Analyte	MRL	UNIT	RL	Action Level CT Drinking Water
Perfluorooctanesulfonic acid (PFOS)	ND	(µg/L)	2.0	10
Perfluorononanoic acid (PFNA)	ND	(µg/L)	2.0	12
Perfluorooctanoic acid(PFOA)	ND	(µg/L)	2.0	16
Perfluorohexane sulfonic acid(PFHxS)	ND	(µg/L)	2.0	49
Perfluorohexanoic acid (PFHxA)	ND	(µg/L)	2.0	240
Perfluorobutane sulfonic acid (PFBS)	ND	(µg/L)	2.0	760
Lithium, total	ND	(µg/L)	2.0	NA

Reference City of Waterbury 2025 Water Quality Report

PROTECTING OUR WATER

We all play a role in keeping Watertown's drinking water clean and our environment healthy.

HOW CAN YOU HELP PROTECT WATER SUPPLIES?

WATER ONLY WHEN NECESSARY

The most effective time is early in the morning — never on windy, rainy, or very hot days. Use water with an efficient, slow soaking irrigation system.

USE PESTICIDES AND FERTILIZERS WISELY

Follow the directions, apply only what is needed, and do not over use. When in doubt, consult an expert.

MAINTAIN YOUR SEPTIC SYSTEM

Regular maintenance prevents contamination of our lakes, rivers, and groundwaters.

DO NOT DUMP

Dispose of trash, waste motor oil, and household hazardous wastes properly. Check with Town Hall proper disposal of these wastes.

REPORT ANY POLLUTING ACTIVITIES

If you see illegal dumping, waste discharges, chemical spills, etc., please report them to the **Connecticut Department of Energy and Environmental Protection (CTDEEP)** at **860-424-3338**, the local police, health department or the Water Department.

WHAT CAN YOU DO TO SAVE WATER AT HOME?

Check for leaky toilets (put a drop of food coloring in the tank and let it sit. If the bowl turns color, then you have a leak). Check the over fill line inside the tank and be sure it's not running over down the drain.

Consider replacing your five-gallon per flush toilet with an efficient 1.6-gallon per flush unit. This will permanently cut your water consumption by 25%.

Fix leaking fixtures as soon as possible. A leaking faucet or toilet can dribble away thousands of gallons of water a year.

Run only full loads in dishwashers and washing machines. Rinse all handwashed dishes at once.

Turn off the water while brushing your teeth or shaving.

WE'RE HERE FOR YOU

TOWN OF WATERTOWN WATER & SEWER AUTHORITY
